

B120

THERMAL TRANSFER RIBBON

GREY IS THE NEW BLACK

ShineMark have a flat head wax resin called B120 and this product is unique within our range of thermal transfer ribbons in that it has an almost grey appearance on one side. This is because the released layer has properties that give flexibility and adaptability to:

Print on the widest range of self-adhesive and tag materials from vellum right through to Valeron synthetics

B120 generates good quality scannable barcodes irrespective of the condition of the thermal transfer printer

Whether the print conditions are hot and humid or cold and wet – B120 continues to print impressive text and scannable barcodes

Whilst the logistics continue to adapt and overcome shipping delays due to the pandemic, B120 is certainly an alternative to products where you may be experiencing delays.
